

# *Ownership and Borrowing*

**Nicholas Matsakis**

**High-level coding, low-level efficiency**

*Hack without fear!*

## Performance

```
class ::String
def blank?
  /\A[[:space:]]*\z/ == self
end
end
```

Ruby:  
964K iter/sec

```

static VALUE
rb_str_blank_as(VALUE str)
{
    rb_encoding *enc;
    char *s, *e;

    enc = STR_ENC_GET(str);
    s = RSTRING_PTR(str);
    if (!s || RSTRING_LEN(str) == 0) return Qtrue;

    e = RSTRING_END(str);
    while (s < e) {
        int n;
        unsigned int cc = rb_enc_codepoint_len(s, e, &n, enc);

        switch (cc) {
            case 9:
            case 0xa:
            case 0xb:
            case 0xc:
            case 0xd:
            case 0x20:
            case 0x85:
            case 0xa0:
            case 0x1680:
            case 0x2000:
            case 0x2001:
            case 0x2002:
            case 0x2003:
            case 0x2004:

```

```

            case 0x2005:
            case 0x2006:
            case 0x2007:
            case 0x2008:
            case 0x2009:
            case 0x200a:
            case 0x2028:
            case 0x2029:
            case 0x202f:
            case 0x205f:
            case 0x3000:
#if ruby_version_before_2_2()
            case 0x180e:
#endif
/* found */
break;
default:
return Qfalse;
}
s += n;
}
return Qtrue;
}

```

[https://github.com/SamSaffron/fast\\_blank](https://github.com/SamSaffron/fast_blank)

## Performance

Ruby:  
964K iter/sec

I  
10x!

C:  
10.5M iter/sec

## Performance

```
class ::String
def blank?
  /\A[[:space:]]*\z/ == self
end
end
```

```
extern "C" fn fast_blank(buf: Buf) -> bool {
    buf.as_slice().chars().all(|c| c.is_whitespace())
}
```

Get Rust  
string slice

Get iterator over  
each character

Are all characters  
whitespace?

Ruby:  
964K iter/sec

C:  
10.5M iter/sec

Rust:  
11M iter/sec

# Parallel Programming

```
fn load_images(paths: &[PathBuf]) -> Vec<Image> {
    paths.iter() ← For each path...
        .map(|path| {
            Image::load(path) ← ...load an image...
        })
        .collect() ← ...create and return
    } a vector.
```

# Parallel Programming

```
extern crate rayon;
```

Third-party library

```
fn load_images(paths: &[PathBuf]) -> Vec<Image> {
    paths.par_iter()           ...make it parallel.
        .map(|path| {
            Image::load(path)
        })
        .collect()
}
```

**Can also do:** processes with channels,  
mutexes, non-blocking data structures...

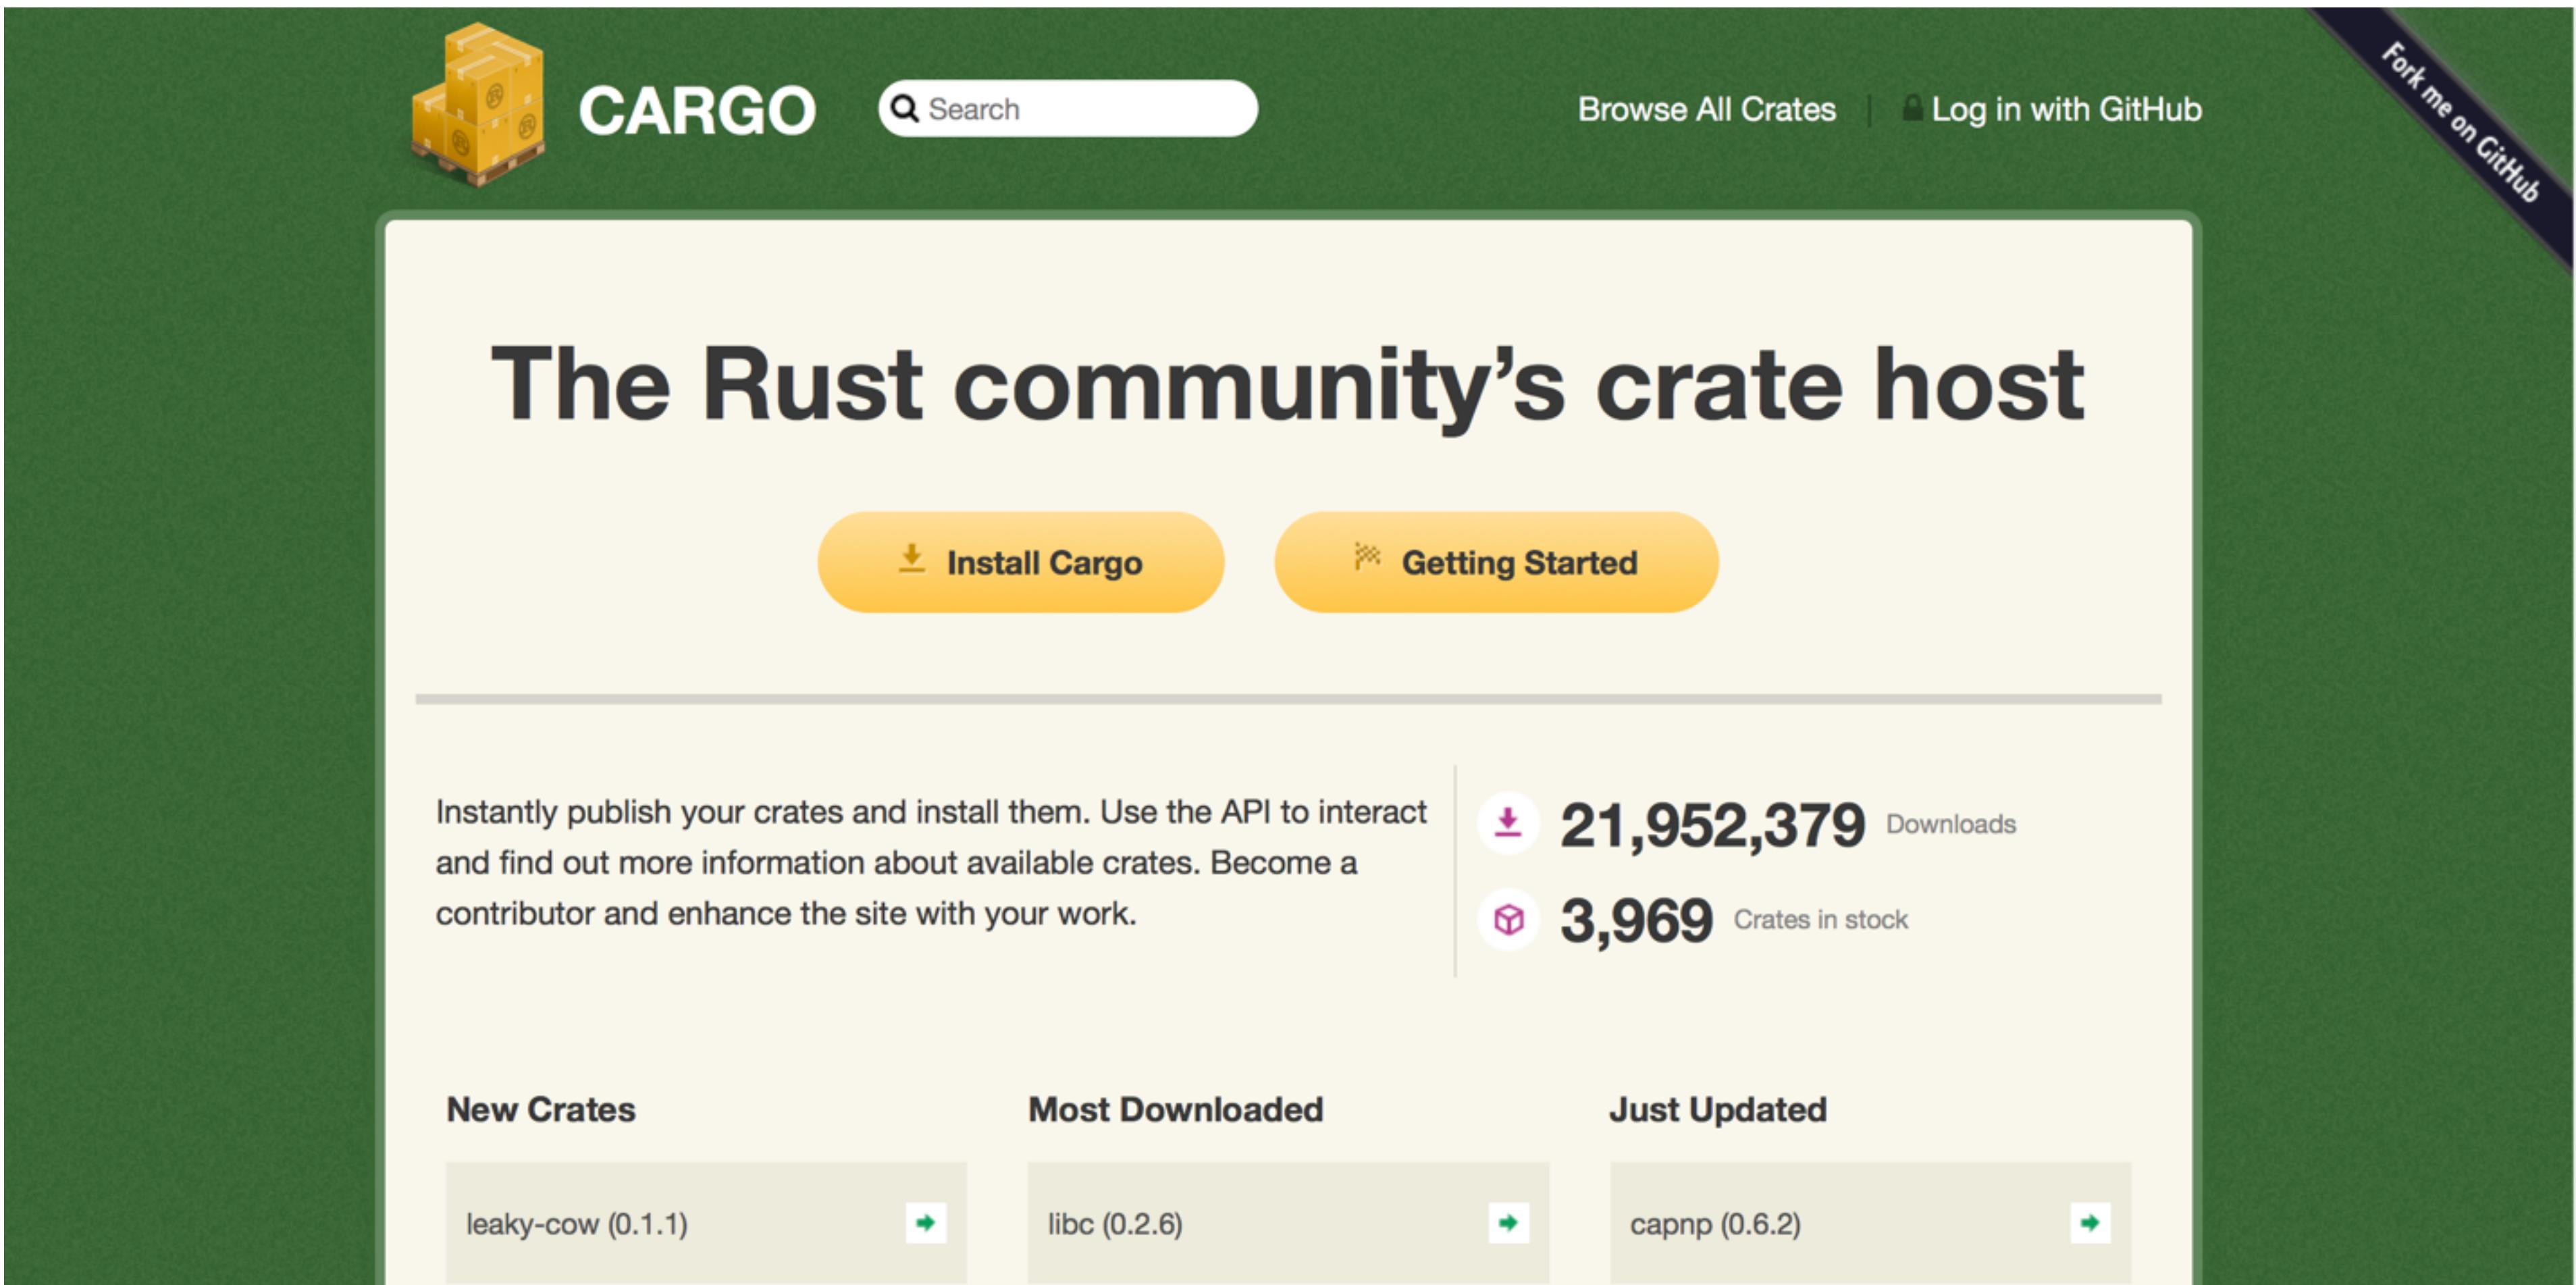

# Safer Parallel Programming

```
fn load_images(paths: &[PathBuf]) -> Vec<Image> {
    let mut jpegs = 0; ← Data-race
    paths.par_iter()
        .map(|path| {
            if path.ends_with("jpeg") { jpegs += 1; }
            Image::load(path)
        })
        .collect();
}
```

Will not compile

To fix: use **AtomicU32**, **Mutex**, etc.

# Cargo and crates.io

The screenshot shows the homepage of crates.io, a dark-themed website. At the top left is the "CARGO" logo with a yellow icon of three stacked shipping boxes. To its right is a search bar with a magnifying glass icon. On the far right of the header are links for "Browse All Crates" and "Log in with GitHub". A blue diagonal banner on the right side says "Fork me on GitHub". The main title "The Rust community's crate host" is centered above two yellow buttons: "Install Cargo" with a download icon and "Getting Started" with a gear icon. Below this is a section with text about publishing crates and interacting with the API, followed by two statistics: "21,952,379 Downloads" and "3,969 Crates in stock". At the bottom, there are three sections: "New Crates" (leaky-cow 0.1.1), "Most Downloaded" (libc 0.2.6), and "Just Updated" (capnp 0.6.2).

**The Rust community's crate host**

Install Cargo   Getting Started

Instantly publish your crates and install them. Use the API to interact and find out more information about available crates. Become a contributor and enhance the site with your work.

**21,952,379** Downloads

**3,969** Crates in stock

New Crates   Most Downloaded   Just Updated

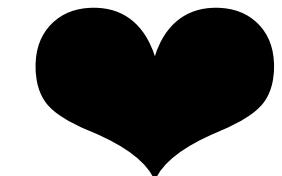

leaky-cow (0.1.1)   libc (0.2.6)   capnp (0.6.2)

# Open and welcoming

Rust has been **open source** from the beginning.

Open governance model based on **public RFCs**.

We have an **active, amazing community**.

# Hello, world!

# Hello, world!

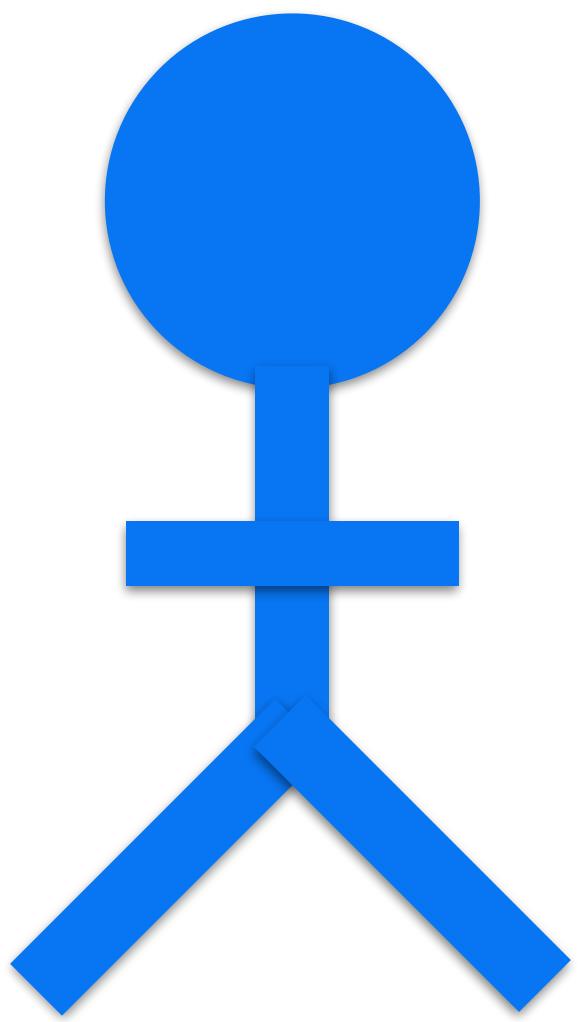

```
fn main() {  
    println!("Hello, world!");  
}
```

# **Ownership**

*n.* The act, state, or right of possessing something.

# **Borrow**

*v.* To receive something with the promise of returning it.

# Ownership

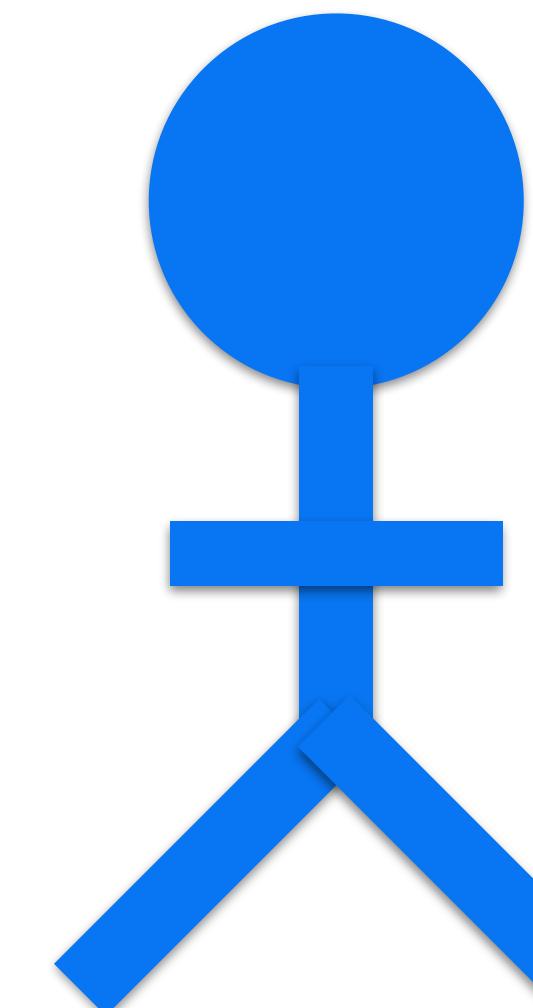

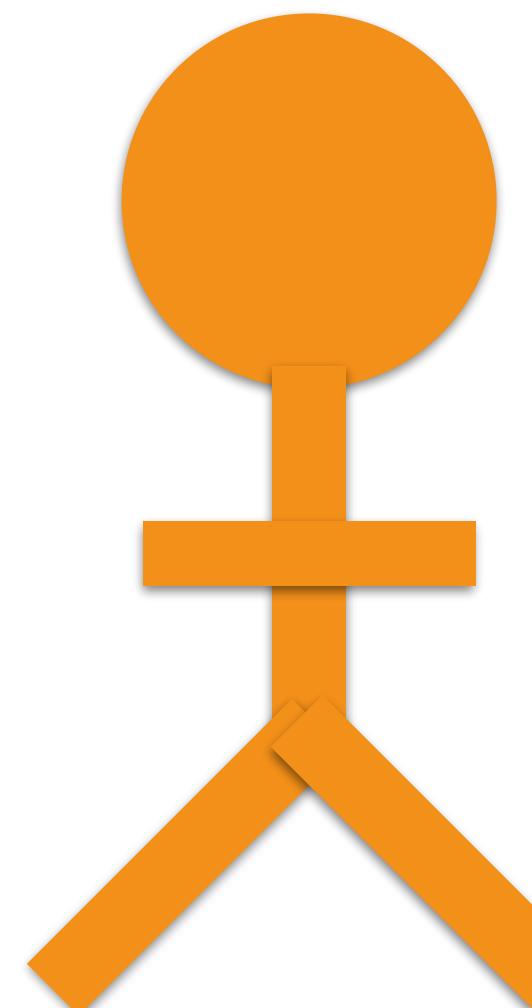

```
fn main() {  
    let name = format!("...");  
    helper(name);  
    helper(name)  
}
```

```
fn helper(name: String) {  
    println!(..); ↑  
}
```

Take ownership  
of a String

Error: use of moved value: `name`

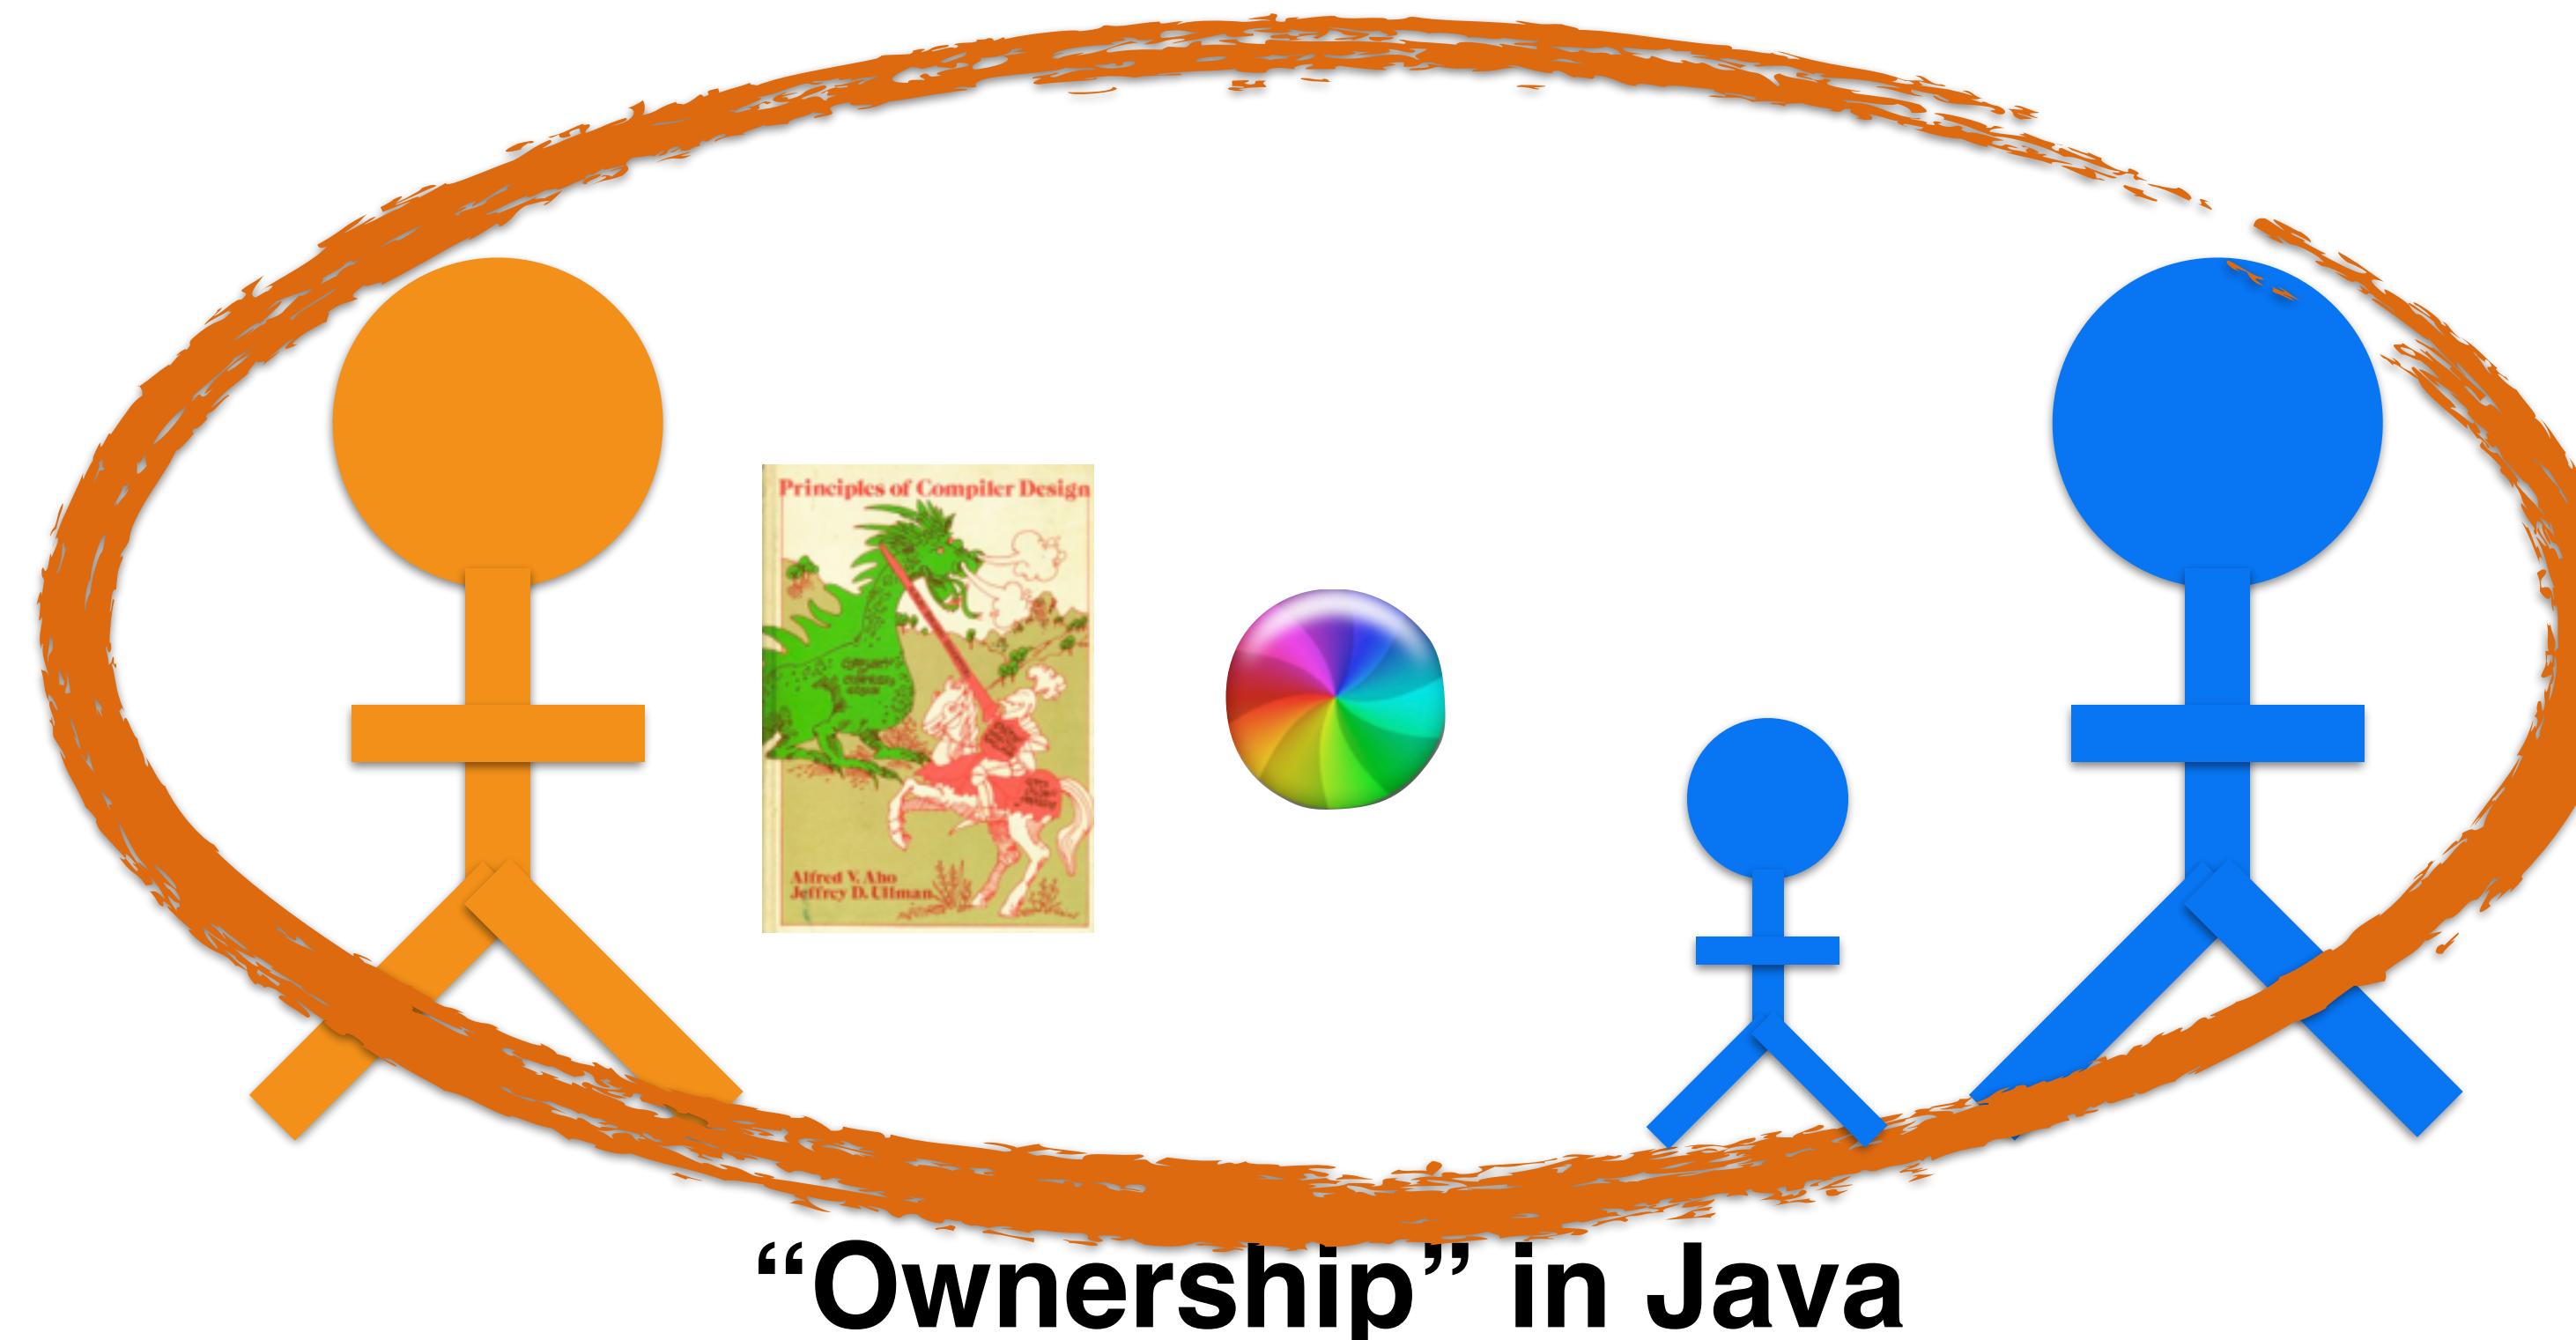

Ownership

```
void main() {  
    Vector name = ...;  
    helper(name);  
    helper(name);  
}
```

```
void helper(Vector name) {  
    new Thread(...);  
}
```

Take reference  
to Vector

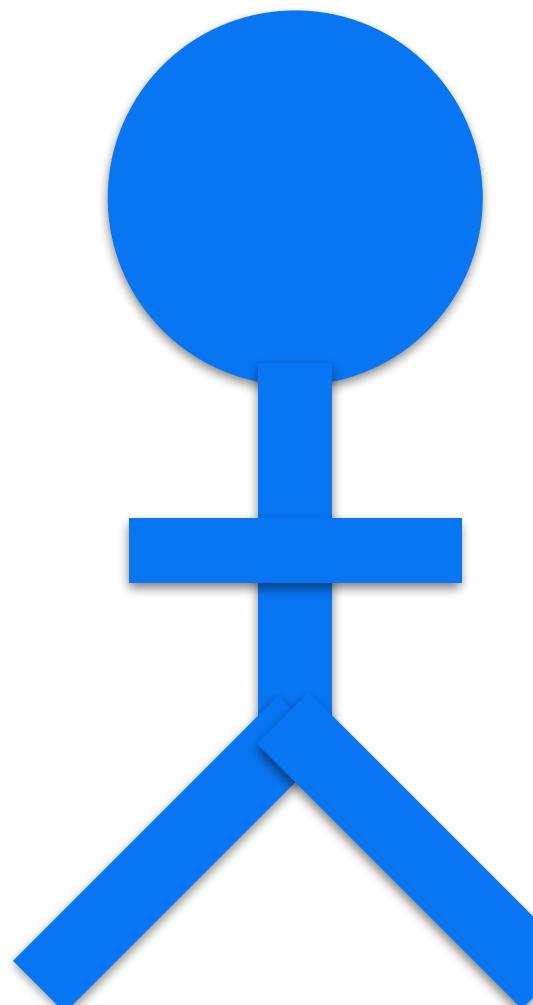

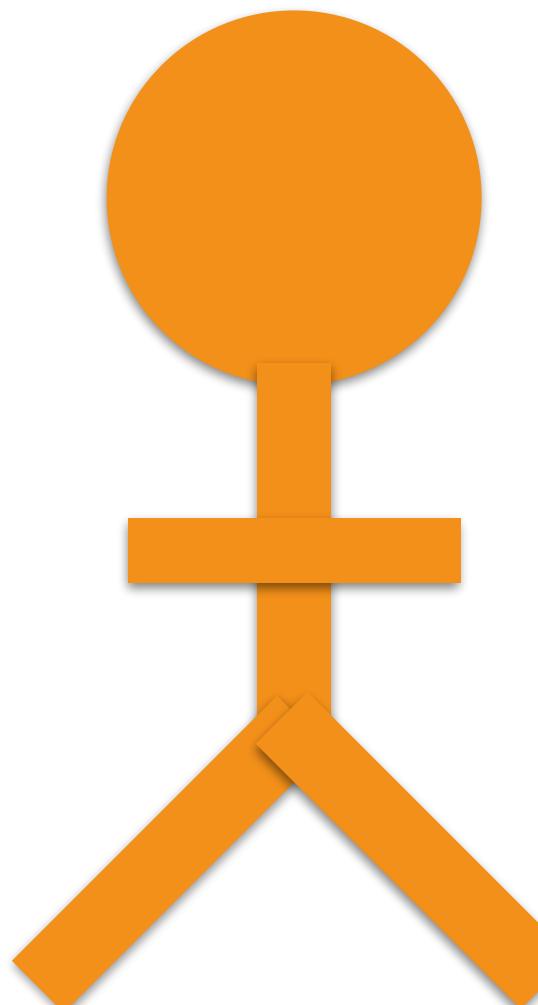

# Clone

```
fn main() {  
    let name = format!("...");  
    helper(name.clone());  
    helper(name);  
}
```

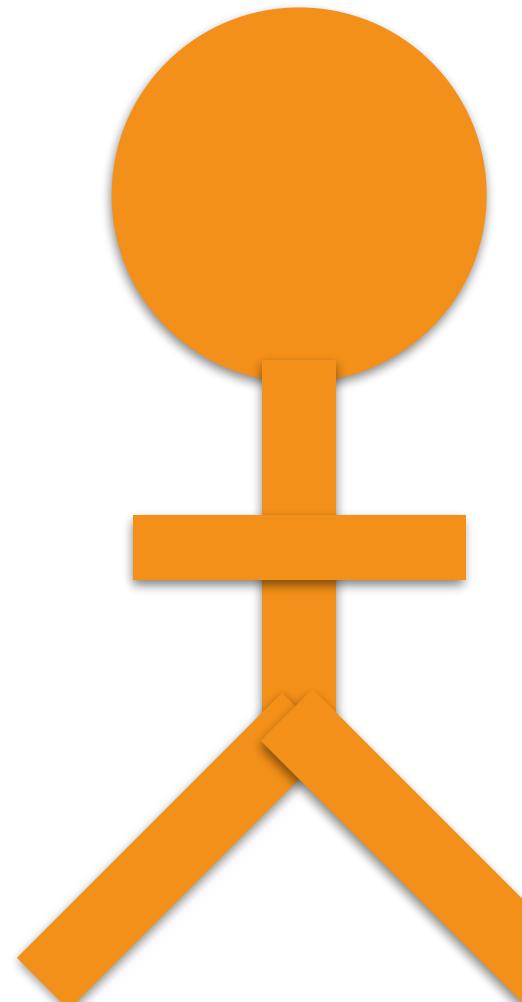

Copy the String

```
fn helper(name: String) {  
    println!(..);  
}
```

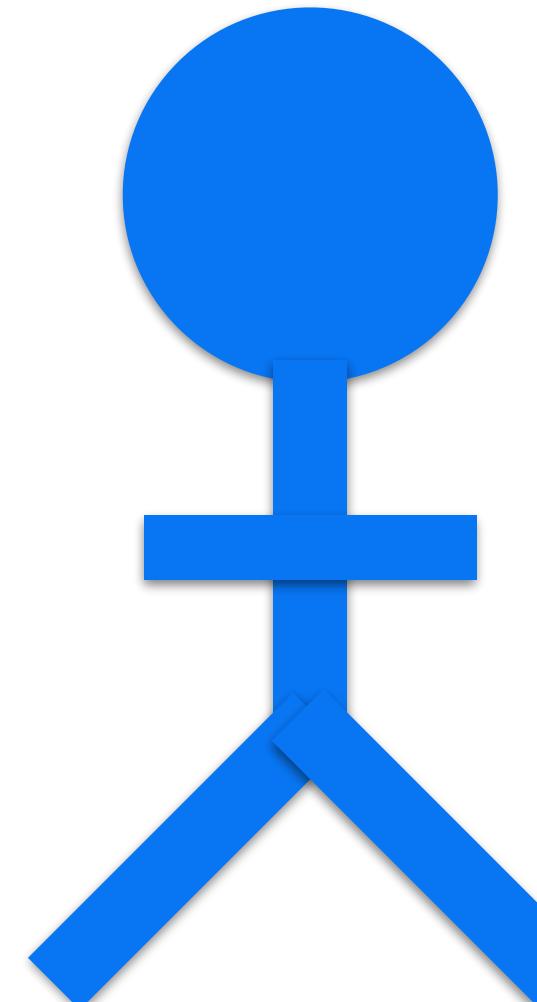

# Copy (auto-Clone)

```
fn main() {  
    let name = 22;  
    helper(name);  
    helper(name);  
}
```

```
fn helper(name: i32) {  
    println!(..);  
}
```

i32 is a Copy type

**Non-copyable:** Values **move** from place to place.

**Examples:** *TCP/IP connection, database handle.*

**Clone:** Run custom code to make a copy.

**Examples:** *String, Vector*

**Copy:** Type is implicitly copied when referenced.

**Examples:** *u32, i32, (f32, i32).*

# Exercise: ownership

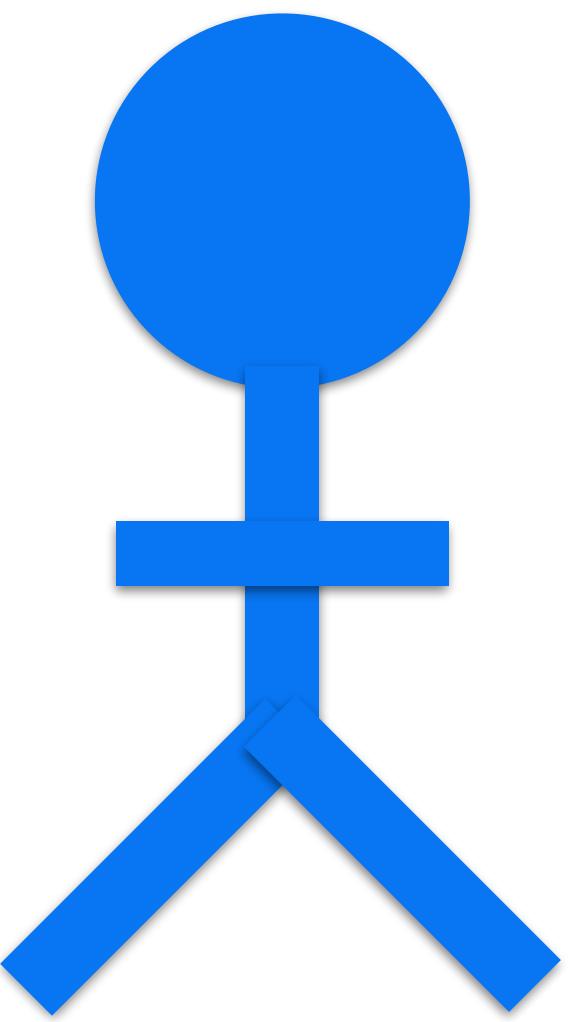

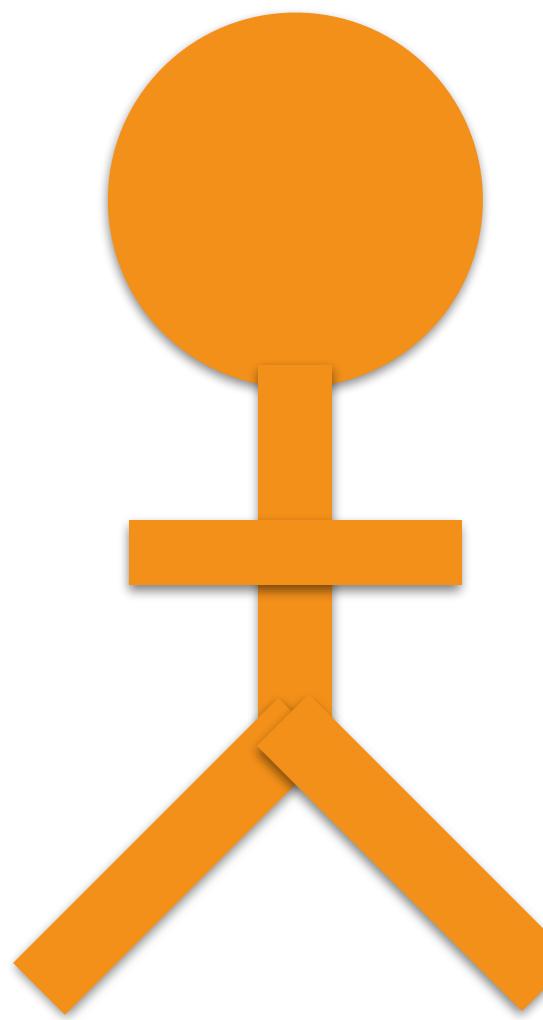

**<http://rust-tutorials.com/exercises/>**

## Cheat sheet:

fn helper(name: String) // takes ownership

string.clone() // clone the string

<http://doc.rust-lang.org/std>

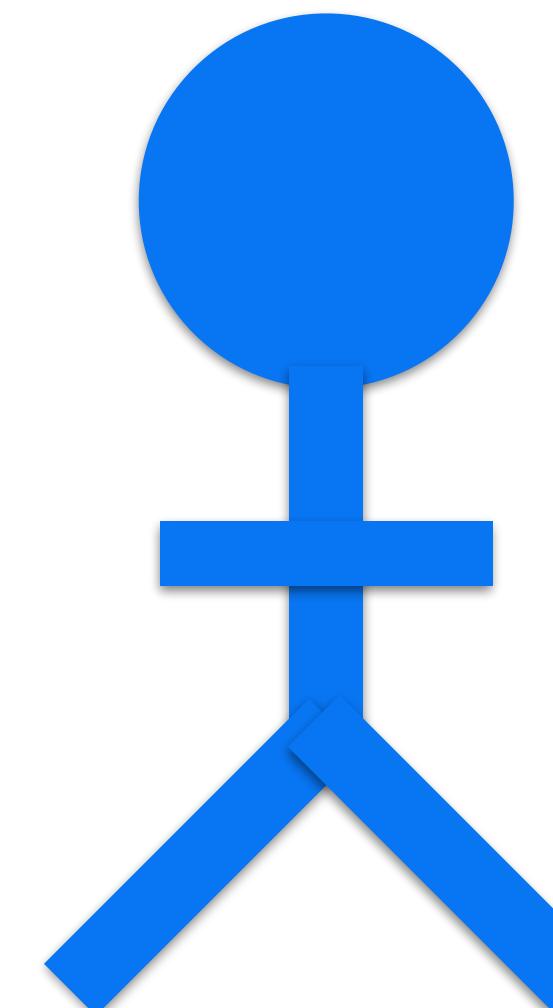

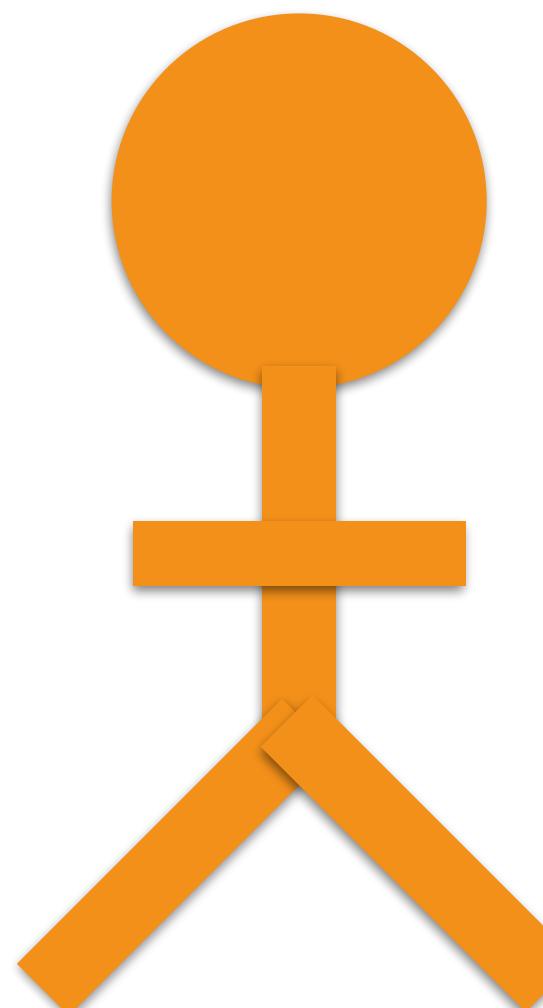

# Borrowing: Shared Borrows

```
fn main() {  
    let name = format!("...");  
    helper(&name);  
    helper(&name);  
}
```

Lend the string

```
fn helper(name: &String) {  
    println!(..);  
}
```

Take a **reference**  
to a String

Shared borrow

# Shared == Immutable<sup>\*</sup>

```
fn helper(name: &String) {  
    println!("{}", name); ← OK. Just reads.  
}  
}
```

```
fn helper(name: &String) {  
    name.push_str("foo"); ← Error. Writes.  
}  
}
```

```
error: cannot borrow immutable borrowed content `*name`  
      as mutable  
      name.push_str("s");  
      ^~~~
```

\* **Actually:** mutation only in **controlled circumstances**.

# Play time

Waterloo, Cassius Coolidge, c. 1906

```
fn main() {  
    let name = format!("...");  
    helper(&name[1..]);  
    helper(&name);  
}
```

Lend some of  
the string

Lend entire string

```
fn helper(name: &str) {  
    println!(..);  
}
```

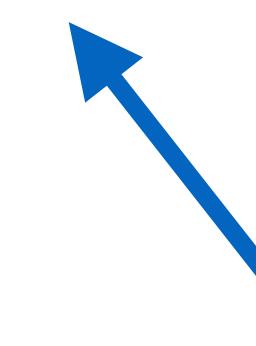

Take a reference  
to a **string slice**

**Note:** Looks like Python, but **no copying** at runtime.

## String slices

# High-level code, low-level efficiency

```
for word in line.split(' ') {  
    sum += word.len();  
}
```

Iterator over slices  
borrowed from **line**.

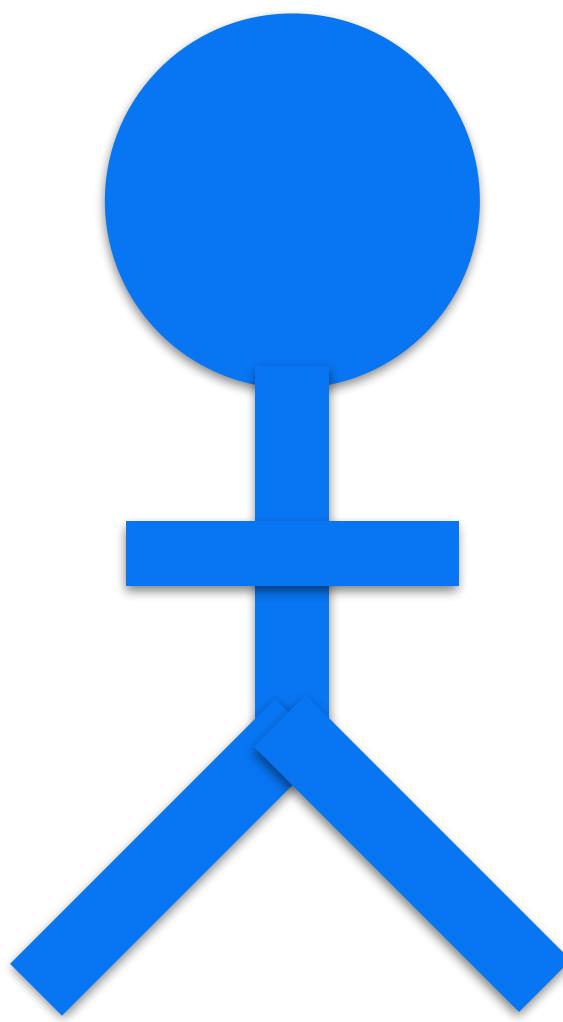

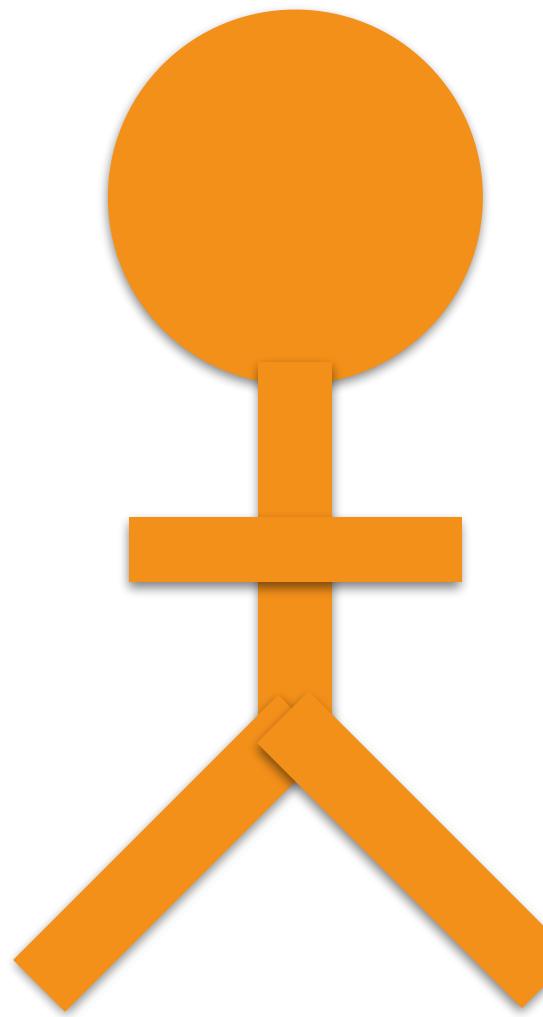

**No copying, no allocation.**

# Exercise: shared borow

<http://rust-tutorials.com/exercises/>

## Cheat sheet:

```
&String           // type of shared reference  
&str             // type of string slice  
  
fn greet(name: &String) {...}  
  
&name            // shared borrow  
&name[x..y]      // slice expression
```

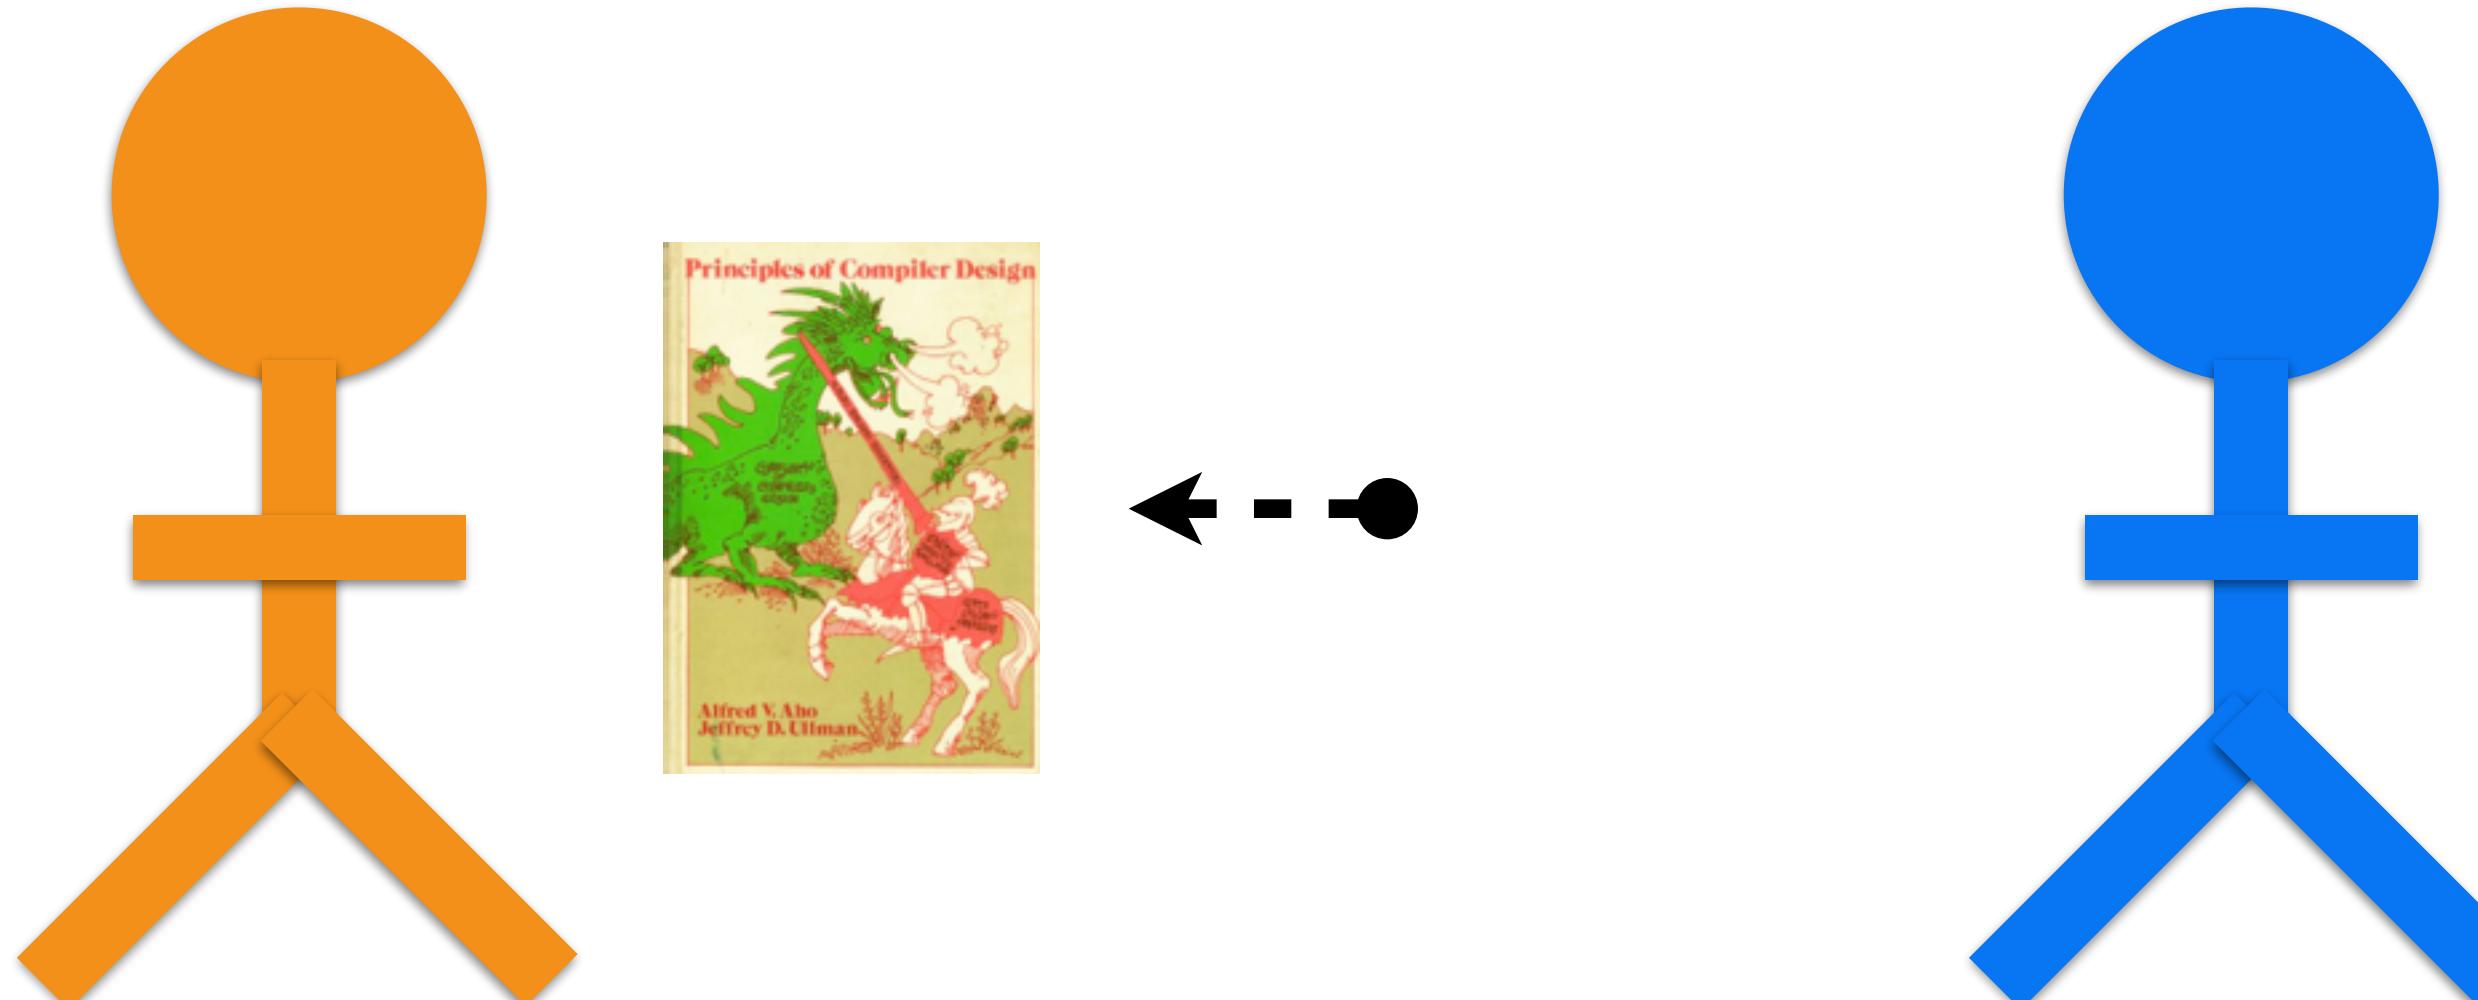

# Borrowing: Mutable Borrows

```
fn main() {  
    let mut name = ...;  
    update(&mut name);  
    println!("{}↑, name");  
}
```

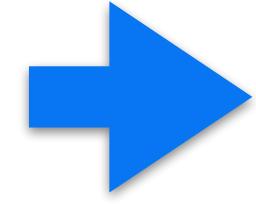

Lend the string  
**mutable**ly hints the  
updated string.

```
fn update(name: &mut String) {  
    name.push_str("...");  
}
```

Take a **mutable**  
**reference** to a String  
Mutate string  
in place

**Mutable borrow**

`name: String`

**Ownership:**

control all access, will free when done

`name: &String`

**Shared reference:**

many readers, no writers

`name: &mut String`

**Mutable reference:**

no readers, one writer

# Play time

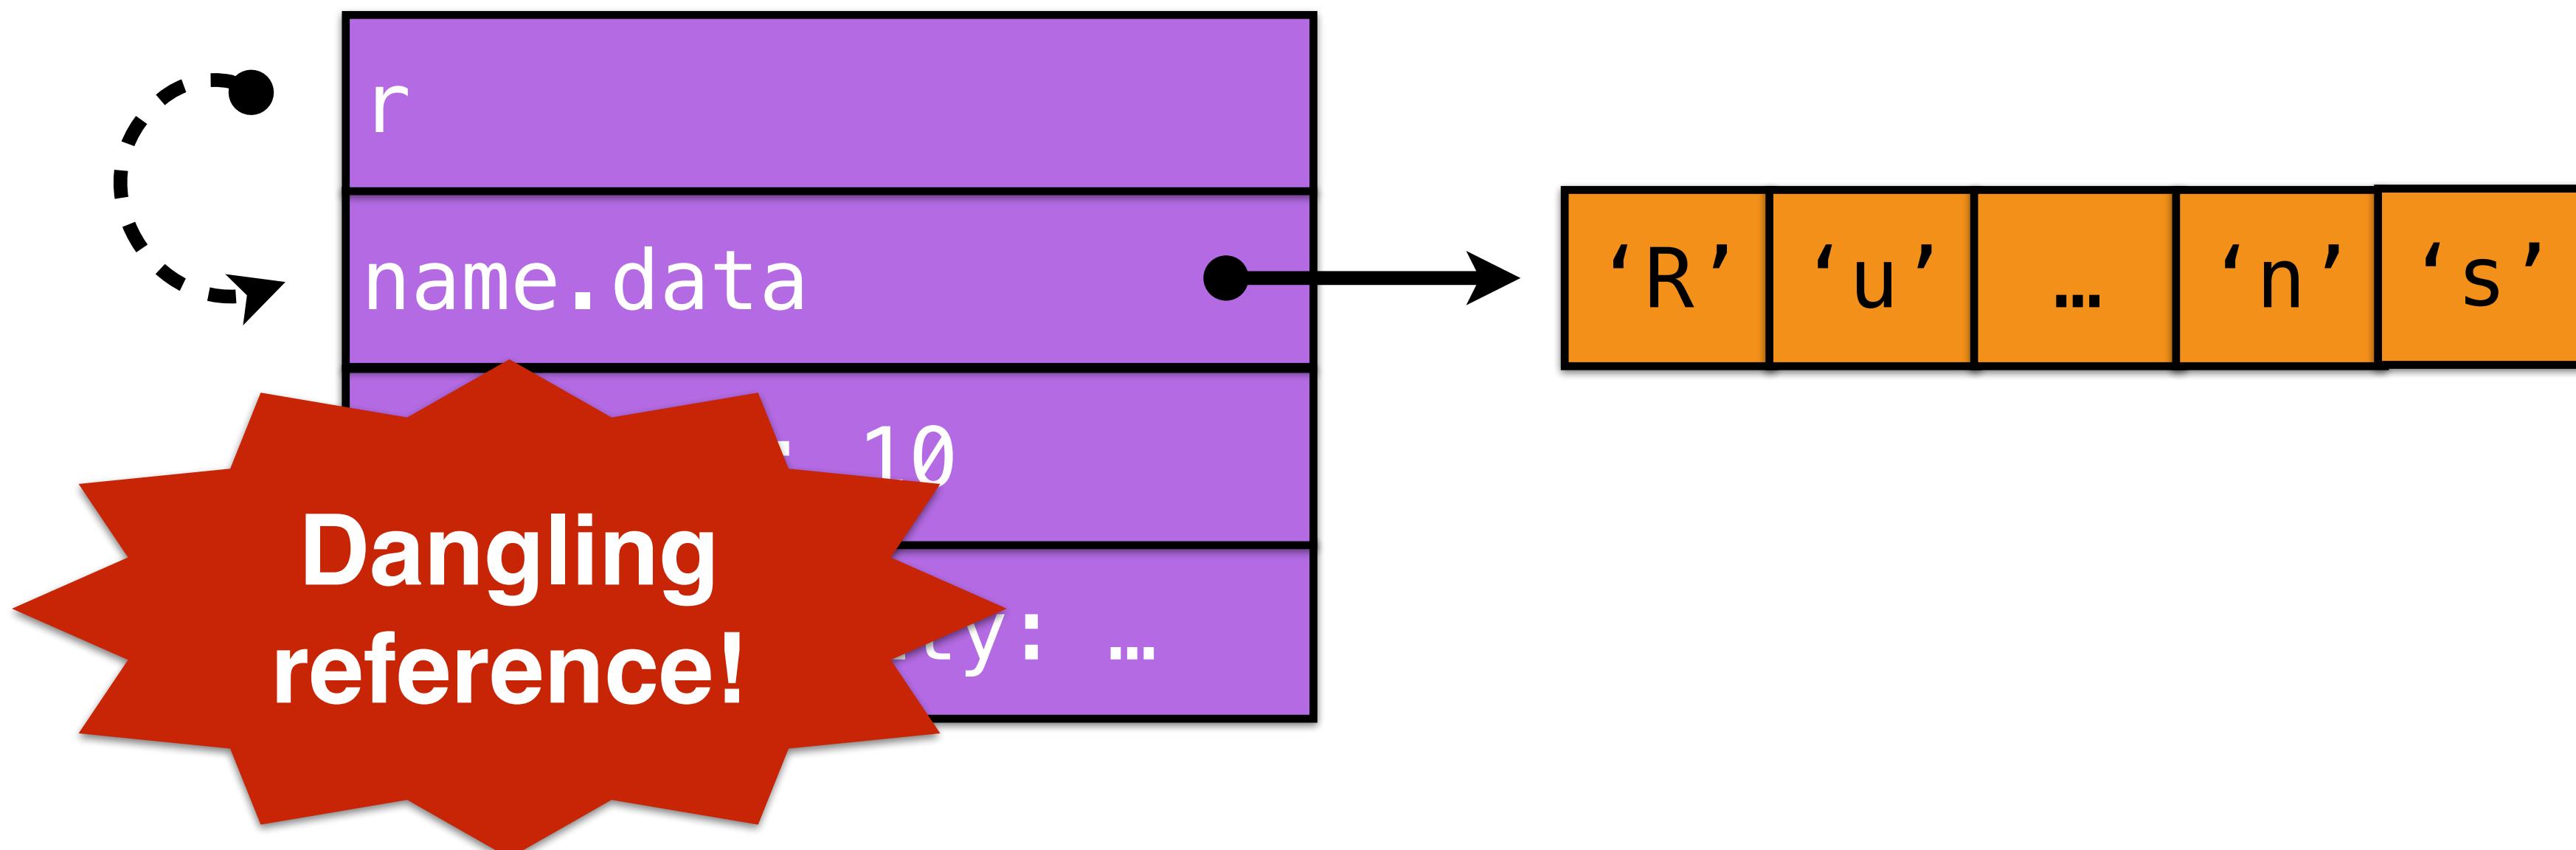

Waterloo, Cassius Coolidge, c. 1906

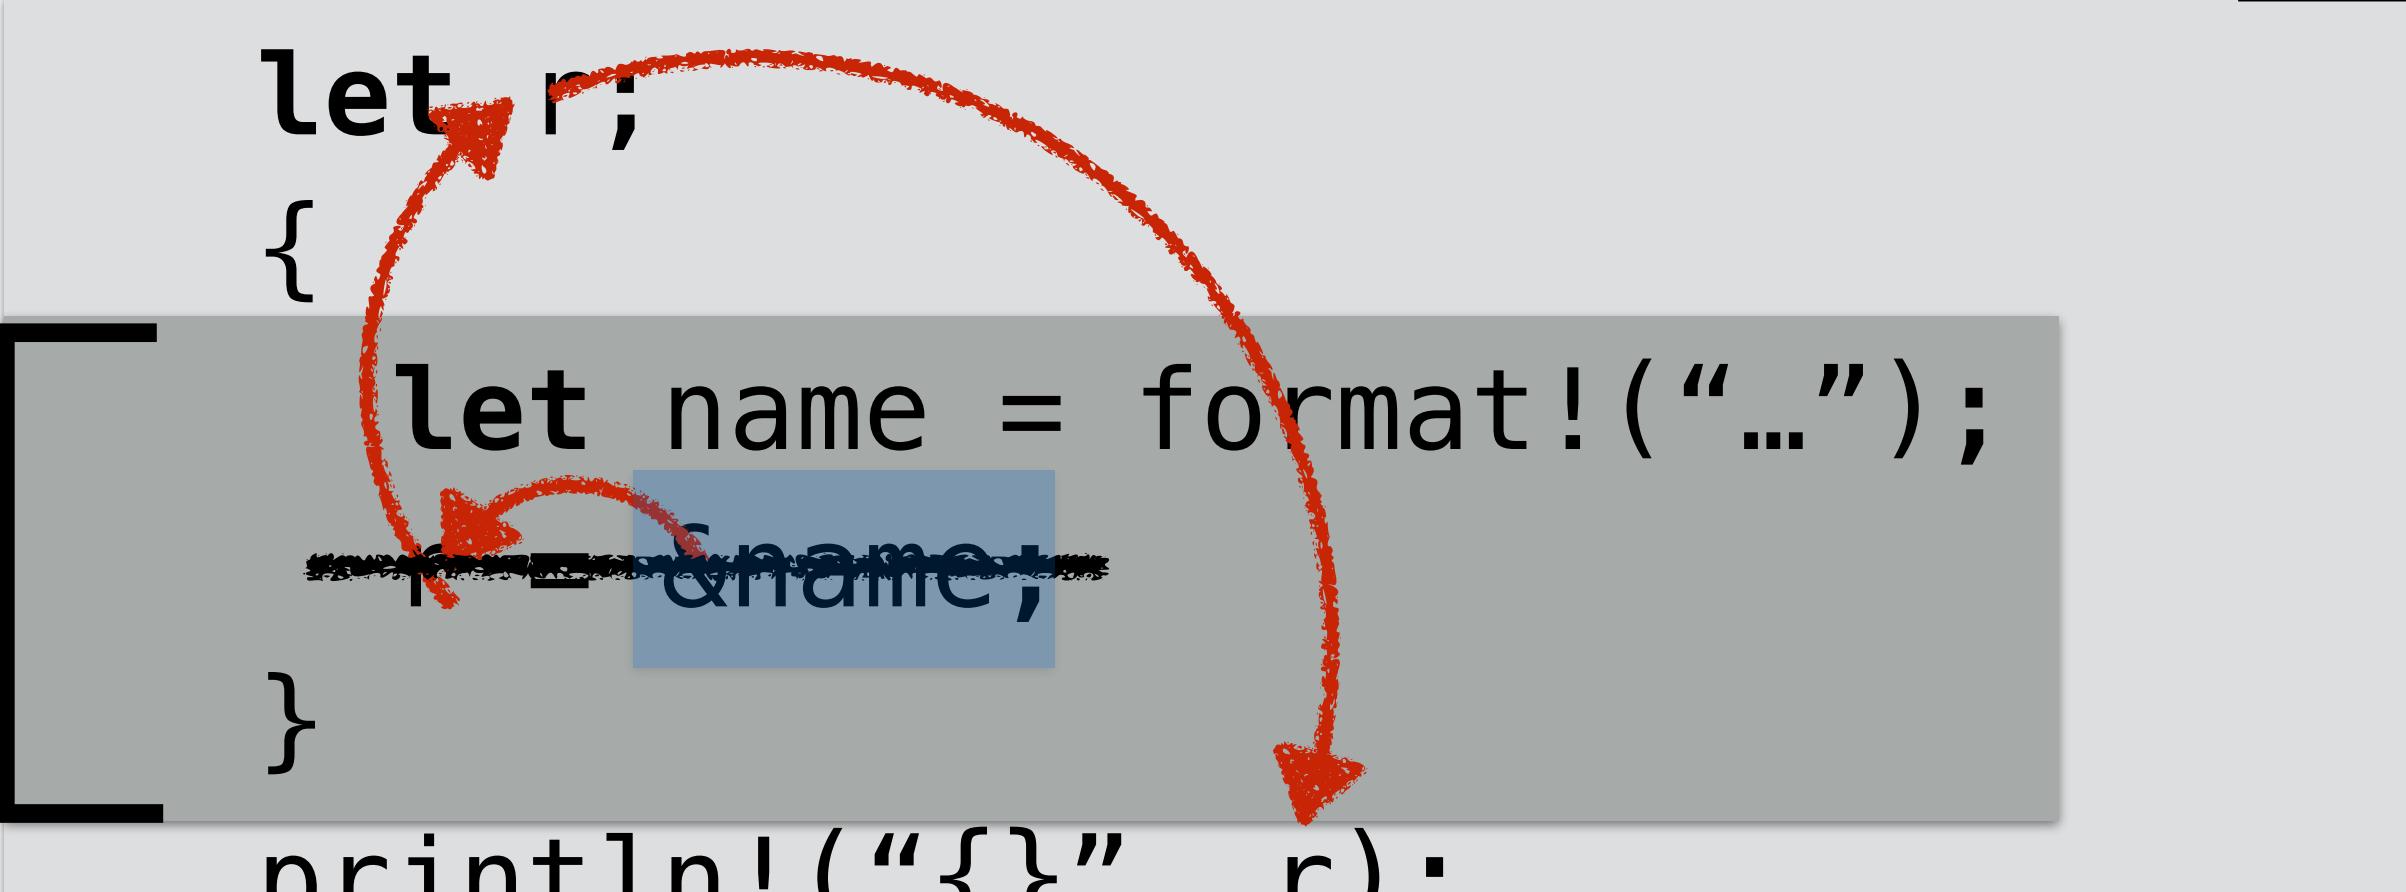

# Whither Safety?

```
fn main() {  
    let r;  
    {  
        let name = format!("...");  
        r = &name;  
    }  
    println!("{}", r);  
}
```

```
fn main() {  
    let r;  
    {  
        let name = format!("...");  
        r = &name;  
    }  
    println!("{}", r);  
}
```

**Lifetime:** span of code where reference is used.

*compared against*

**Scope** of data being borrowed (here, `name`)

```
error: `name` does not live long enough  
      r = &name;  
           ^~~~
```

```
use std::thread;
```

```
fn helper(name: &String) {  
    thread::spawn(move || {  
        use(name);  
    });  
}
```

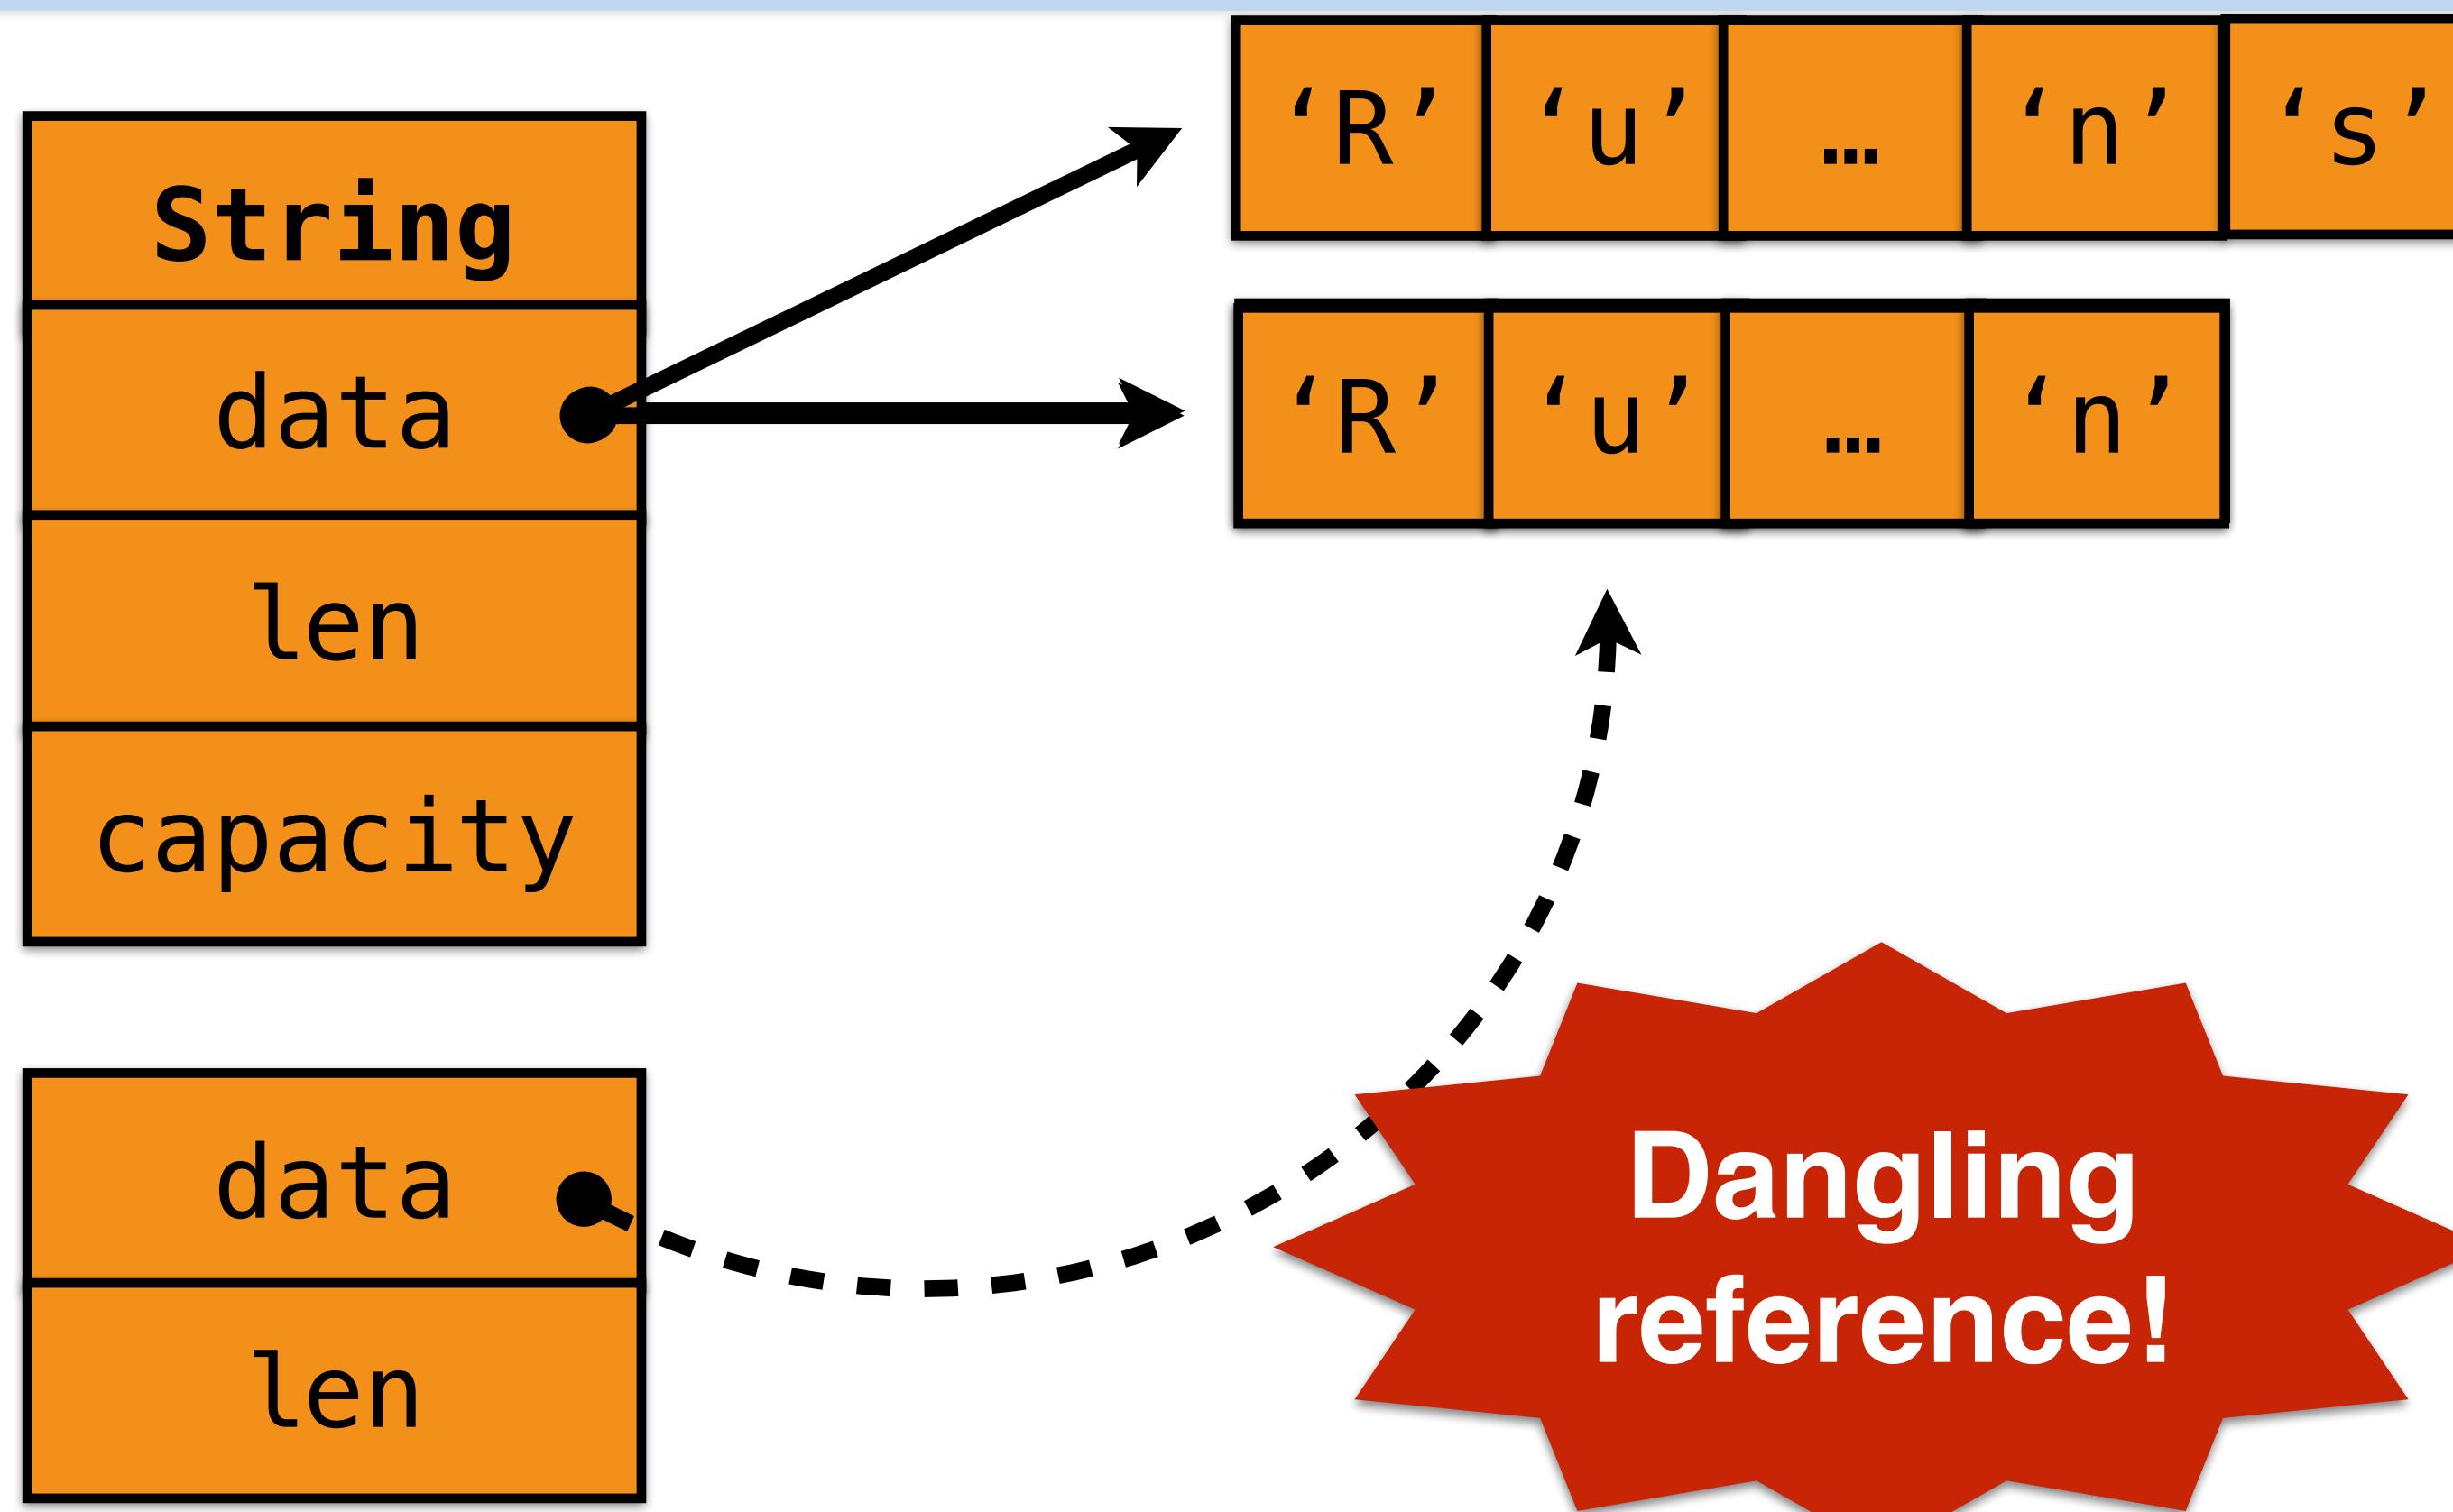

name` can only be used within this fn

**However:** see **rayon**,  
**crossbeam**, etc on [crates.io](https://crates.io)

```
error: the type `[...]` does not fulfill the required lifetime  
thread::spawn(move || {  
^~~~~~  
note: type must outlive the static lifetime
```

# Dangers of mutation

```
let mut buffer: String = format!("Rustacean");
let slice = &buffer[1..];
buffer.push_str("s");
println!("{}:?", slice);
```

# Rust solution

## Compile-time read-write-lock:

Creating a shared reference to X “**read locks**” X.

- Other readers OK.
- No writers.
- Lock lasts until reference goes out of scope.

Creating a mutable reference to X “**writes locks**” X.

- No other readers or writers.
- Lock lasts until reference goes out of scope.

**Never have a reader/writer at same time.**

# Dangers of mutation

```
fn main() {  
    let mut buffer: String = format!("Rustacean");  
    let slice = &buffer[1..];  
    buffer.push_str("s");  
    println!("{}:?", slice);  
}
```

**Borrow “locks”**  
`buffer` until `slice`  
goes out of scope

```
error: cannot borrow `buffer` as mutable  
      because it is also borrowed as immutable  
      buffer.push_str("s");  
      ^~~~~~
```

```
fn main() {  
    let mut buffer: String = format!("Rustacean");  
    for i in 0 .. buffer.len() {  
        let slice = &buffer[i..];  
        buffer.push_str("s");  
        println!("{}:?", slice);  
    }  
    buffer.push_str("s");  
}
```

**Borrow** “locks”  
`buffer` until `slice`  
goes out of scope

**OK:** `buffer` is not borrowed here

# Exercise: mutable borrow

<http://rust-tutorials.com/exercises/>

## Cheat sheet:

<code>&amp;String</code>	// type of shared reference
<code>&amp;mut String</code>	// type of mutable reference
<code>&amp;str</code>	// type of string slice
<code>fn greet(name: &amp;String) {}</code>	
<code>fn adjust(name: &amp;mut String) {}</code>	
<code>&amp;name</code>	// shared borrow
<code>&amp;mut name</code>	// mutable borrow
<code>&amp;name[x..y]</code>	// slice expression

<http://doc.rust-lang.org/std>
